

MONITORING WELL DESIGN
For Ground Water Quality Monitoring
At Top Of Water Table

- NOTES**
1. The total depth of the monitoring well will depend upon the static water table depth.
 2. If the type of sampling requires a sterilized system, order casing, screen and filter material accordingly.
 3. The portion of the Filter Pack that exists below the water table should be placed by tremie pipe.
 4. After the well is installed, it is suggested that the well be developed. This process flushes residues and cuttings and improves the flow from the formation through the filter and screen into the well.

Not To Scale
